

PowerPath — the AI that runs your company's **electricity decisions.**

Working product

Malaysia first · Southeast Asia next

Pre-seed

— THE PROBLEM

One electricity decision is scattered across **seven documents that nobody owns.**

Three forces just collided — and companies are deciding blind.

01 • RULES

Changing faster than ever

Malaysia restructured electricity tariffs in **July 2025** and keeps updating its green-power schemes through 2026. Yesterday's answer is stale.

02 • STAKES

Exploding demand

The data-centre and electrification boom in the **Johor–Singapore corridor** is turning power into a board-level constraint on growth.

03 • CAPABILITY

AI can finally read it all

Bills, regulations, quotes and contracts are documents. **AI can now read every one of them** — and keep reading as they change.

— THE SOLUTION

PowerPath reads everything, watches the market, and tells you what to do — **with defensible numbers.**

POWERPATH

THE LIVE PRODUCT

Out comes **one ranked answer** and a board-ready memo — every number computed, sourced, and human-approved.

— HOW IT WORKS

Five AI agents run the workflow. A deterministic engine does the math. **Humans approve.**

⚙ ENGINE

The calculator the agents call as a tool — same inputs, same outputs, like a spreadsheet, not a chatbot. A trace on every figure

SOURCES

Verified official registry; immutable, fingerprinted snapshots

HUMAN

Approval gate — nothing changes a recommendation silently

AI runs the entire workflow — but it is architecturally unable to invent a number. Every figure is computed by the engine with a source trace.

When the market changes, PowerPath changes its recommendation — before you even ask.

Grid access charge just changed at the source¹

RM0.08/kWh → RM0.045/kWh • detected by Watchtower • document fingerprint changed

NEEDS REVIEW

✓ Approve (demo replay)

Ignore

SOLAR + SCHEME (RECOMMENDED)

RM6.98M/yr

SCHEME ONLY

RM8.47M/yr

BOARD MEMO

v0.1 • current

Awaiting the human decision — recommendations unchanged until someone approves.

90-second demo

AI voice (ElevenLabs) narrates what it detected, why the answer changed, and cites the source document.

TODO record & drop video here

¹ the access charge under Malaysia's green-power scheme (glossary, appendix) • engine formulas on request

A consultant that never stops watching — and shows its sources.

Real screen • click a tag to zoom

Five strategies in, one ranked answer out — every trade-off on the table.

BALANCED COST-FIRST

STRATEGY	ANNUAL COST	RM M/YR	Δ VS GRID	2030 ✓
Rooftop solar + green scheme		6.98	-1.43	✓
Rooftop solar only		6.95	-1.46	—
Battery storage		8.07	-0.34	—
Grid as-is		8.41	0.00	—
Green scheme only		8.47	+0.06	✓

Scheme names for the energy-literate: Solar ATAP · CRESS · BESS — glossary in appendix. Annual cost, sample case, demo-grade assumptions v0.1.

AI HERE · RECOMMENDS · EXPLAINS · DRAFTS

Consultants are slow, Excel is fragile, **generic AI makes numbers up.**

Consultants

Trusted — but slow, expensive, non-repeatable. The report is stale the day it lands.

Excel

Flexible — but fragile. No evidence trail, no memory, breaks when its author leaves.

Generic AI chatbots

Fast — but they make numbers up.
Can't face a board or a finance team.

PowerPath

AI-native workflow + deterministic math + audit trail. Consultant-grade reasoning at software speed.

AI runs the entire workflow — but it is architecturally unable to invent a number. Every figure is computed by the engine with a source trace.

A US\$60M Malaysian wedge into a US\$9B global problem.

TOP-DOWN

~US\$0_B

global

~US\$0_M

Southeast Asia

~US\$0_M

Malaysia

ASSUMPTION	VALUE
Decision-intelligence layer share of commercial & industrial (C&I) electricity spend	0.5%
Electricity spend base	Ember/IEA global · IEA SEA · MY 2024 generation

Malaysia C&I

→ Johor-SG corridor

→ TH · VN · ID · PH

BOTTOMS-UP (OBTAINABLE)

INPUT	VALUE
MY C&I accounts > RM1M/yr electricity spend	TODO count
× share facing an active procurement decision	TODO %
× annual contract value (from pilot pricing)	TODO RM
= obtainable market	TODO RM M

The two sizings **triangulate** — same DNA as the product: assumptions on the table, not in a footnote.

Paid pilots today, **subscription tomorrow.**

NOW

Expert-assisted paid pilots

Real power decisions delivered **with** the product for factories, data centres and industrial parks.

TODO pilot price band (RM)

NEXT

Per-site subscription

The consultant that never leaves: monitoring, human-approved reruns, memo refresh, portfolio view.

TODO SaaS price band (RM/site/mo)

THEN

Country modules

Localisation is the repeatable playbook, not a rewrite — each SEA market is a module, not a fork.

Service-assisted entry → repeatable software workflow → portfolio subscription.

The product is live. The next 18 months **turn it into revenue.**

SHIPPED · TODAY

Working MVP

Deterministic engine with calculation traces · live official-source monitoring · real satellite solar data · human-approval audit trail · AI explanation & memo drafting · memo export.

IN MOTION

Pipeline

TODO discovery calls booked

TODO pilot conversations

No pilots, LOIs (letters of intent) or revenue yet — stated plainly.

NEXT 90 DAYS

Targets

20 discovery calls · 3 pilot LOIs · 1 paid pilot · file-upload ingest · richer memo output.

Founder-market fit: **energy domain + AI engineering.**

Kenneth Jong

ENERGY STRATEGY

Guidehouse Energy & Infrastructure consultant
— energy modelling, tariffs, grid charges,
storage, industrial strategy. **He is the
consultant this product encodes.**

Clement Jong

AI ARCHITECT

AI systems, data architecture, product build.
Built the PowerPath MVP end to end — agents,
engine, audit trail.

Built together before

Brothers who have built and operated a venture
together — lean, automated, fast.

TODO prior-venture figures for diligence

TODO full-time status post-funding

THE ASK

Raising US\$[X] to reach [N] paid pilots and RM[Y] ARR in 18 months.

TODO founder inputs

AMOUNT

SAFE, capped

TODO amount + cap

Angels (MBAN) · NEXEA · Cradle
Seed Ventures · Indelible · CIP Spark
grant in parallel (non-dilutive)

USE

18-month runway

TODO split % – team /
product / GTM

First hires: energy-modelling
engineer + full-stack engineer

MILESTONES

To seed

Paid pilots → paying sites →
retention + ARR the seed round
prices on

HOW WE SIZED THE ROUND

- 1 • Ownership math — typical pre-seed sells 10–15%; the raise amount implies the cap range.
- 2 • Comparables — recent SEA pre-seed AI/SaaS rounds.
- 3 • Milestone logic — this money de-risks pilots + retention, the exact things seed prices.

TODO refs

— FOR THE DILIGENT

Appendix

Sizing assumptions · valuation math · glossary · trust architecture

Two sizings, one table each — assumptions on the record.

TOP-DOWN

STEP	BASIS
Global C&I electricity spend	Ember / IEA global electricity data
SEA share	IEA Southeast Asia outlook
Malaysia share	Malaysia 2024 generation data
× 0.5% decision-intelligence layer	software + advisory around site, strategy, tariff exposure, clean-energy feasibility
= ~US\$9B • ~US\$400M • ~US\$60M	global • SEA • Malaysia

BOTTOMS-UP

STEP	VALUE
MY C&I accounts > RM1M/yr spend	TODOcount – TNB/EC data
× share with an active procurement decision	TODO% – from discovery
× annual contract value	TODORM – from pilot pricing
= obtainable market	TODORM M

The bottoms-up build is deliberately unfinished until discovery data exists – same rule as the product: no invented numbers.

The path to the next markup, **not a naked number.**

1 · OWNERSHIP

Dilution math

Pre-seed typically sells **10–15%**. Raise amount ÷ that range ⇒ implied SAFE cap band.

TODO compute from amount

2 · COMPARABLES

SEA pre-seed AI/SaaS

Recent rounds at similar stage & geography bracket the cap.

TODO 3–5 named comps

3 · MILESTONES

What this money de-risks

Paid pilots, retention, ARR — the exact metrics a seed round prices. De-risked metrics ⇒ the markup.

FORWARD MODEL (SIMPLE, HONEST)

pilots → subscriptions → ARR at month 18 → × typical seed/Series-A revenue multiple → next-round value

TODO fill once pricing exists

The real scheme names behind the plain English.

TERM	MEANING	PARAMETERS USED IN THIS DECK
CRESS	Corporate Renewable Energy Supply Scheme – buy renewable power through the grid	"green-power scheme" on slides 1–8
SAC	System Access Charge – per-kWh grid access fee under CRESS	RM0.08 → RM0.045/kWh detected change (provisional, demo-grade)
Solar ATAP	Rooftop self-consumption solar programme	"rooftop solar"; 3,000 kWp sizing heuristic, demo-grade
BESS	Battery Energy Storage System	"battery storage"; peak-shaving model, demo-grade
Tariff restructuring	Malaysia's revised electricity tariff schedule (July 2025)	the "rules changing" proof point on slide 3
C&I	Commercial & industrial electricity customers – factories, data centres, malls	the buyer segment in the market sizing

All scheme parameters are demo-grade assumptions with sources and reviewer status in the product – never official rates.

Four roles. **Strictly separated.**

ENGINE

Calculates

Deterministic formulas; a calculation trace on every result; same inputs, same outputs

SOURCES

Evidence

Verified official registry; immutable snapshots; SHA-256 fingerprint change detection

AI

Explains

Narrates only — numeric audit rejects any figure not in engine output; deterministic fallback if the model fails

HUMAN

Approves

Versioned assumptions; recorded reviews (who/when/what); full audit log; no silent updates

This is what "architecturally unable to invent a number" means in code — **the LLM is the least privileged component in the system.**
